## Executive Summary

The analysis identified mcp (ec2) as the most likely root cause. Its network\_out\_bytes deviated 103% from baseline approximately 9.0 minutes before the primary anomaly was triggered on test/status\_check\_failed\_instance. Cascading effects were observed on: mcp/network\_packets\_in, mcp/network\_packets\_out, test/network\_in\_bytes.

Metric Trend Charts

Recommended Actions

- 1. Investigate CPU/memory pressure on mcp
- 2. Check for runaway processes or scheduled jobs that triggered at this time
- 3. Consider auto-scaling policy review if CPU was the trigger
- 4. Validate that cascading resources have returned to normal baseline values
- 5. Acknowledge this anomaly in the dashboard once remediation is confirmed
